Size does matter! Nanoscience and Nanotechnology hold a key for the future.

At the beginning of the '90s a landmark breakthrough changed forever the way science and technology were conceived and approached. Nanoscience was born, but it wasn't apparently new. Many years prior to the '90s discoveries, humankind was already using nanotechnology, but it might have been too small to be clearly seen... In this talk the benefits and prospects of such an exciting area of knowledge will be presented, its implications for the future of society, and also some of the great achievements that are yet to come. Some answers will be given to questions such as: What's the point on this? Is size that important? Are nanoscience and nanotechnology already in society? Do I have the chance to buy them? Is it that determinant or just a transient fashion? These and many other responses will be shown, in order to demonstrate the importance of (small) size for the future of our society, and how scientific research is the key to achieve such a progress.
